Respiratory Syncytial Virus (RSV) Guidance for Childcares

Respiratory Syncytial Virus (RSV) is a viral disease that primarily affects children but can occur in people of all ages. Most people recover in a week or two, but RSV can be serious, especially for infants and older adults. Most children have been infected with RSV by age two and usually during the winter and early spring months (November-April).

**Important Considerations**

- Children often are infectious before symptoms appear.
  - Excluding children with colds or other respiratory illnesses will probably NOT decrease the likelihood of transmission.
- You should exclude until the child has no fever and can tolerate normal activities.
- A child does **not** have to have a negative RSV test to return to childcare.

**Prevention of RSV**

- Careful and frequent hand washing! (warm water, soap, wash hands for 20 seconds)
- Proper disposal of tissues used to clean the nose and respiratory secretions.
- Prevent children from sharing cups and eating utensils with others.
- Clean and disinfect all surfaces on a regular basis, as well as after contact with ill children.
- Clean and disinfect toys on a regular basis, as well as after contact with ill children.

Follow the guidance in the [School and Childcare Exclusion List](#) for when children should be excluded and can return to childcare.
